

In C, strcmp() is a built-in library function used to compare two strings lexicographically. It takes two strings (array of characters) as arguments, compares these two strings lexicographically, and then returns some value as a result.

The strcmp function in C is used to compare two strings, with syntax: int strcmp(const char *str1, const char *str2);, where str1 and str2 are the strings to compare. It returns 0 if the strings are equal, a negative value if str1 is less than str2, and a positive value if str1 is greater than str2.

```
#include <stdio.h>
#include <string.h>

â\200\213
int main(){

    char* s1 = "Geeks";

    char* s2 = "Geeks";

â\200\213

    // Printing the return value of the strcmp()

    printf("%d", strcmp(s1, s2));

â\200\213

    return 0;

}
```

Output: 0
